

Cut out the given polygons, and stick them in a paper sheet, classifying them into one of the following categories:

- 1- Irregular (unequal sides and angles).
- 2- Equilateral (equal sides, although they may have different angles).
- 3- Equiangular (equal angles, although they may have unequal sides).
- 4- Regular (equal sides and angles. The regular triangle is called "equilateral triangle").

You must name each one according to the number of their sides.
